Part of the [Biodiversity Commons](#), and the [Ecology and Evolutionary Biology Commons](#)

Results

A total of 452 papers potentially relevant to freshwater fish diets were found. Of those papers, 71 were analyzed, with 39 containing relevant, extractable data. The remaining 32 papers had no relevant data or an issue with extraction. In total, 99 tables were extracted, yielding a database with 14572 observations of 22 variables.

Best memory

My best memory was working with and experiencing field work. I met new people, learned many things, saw cool locations, and made many fish puke!
