

The subject of my work is about plant life, minerals, and metals that are indigenous to a planet different from ours, but has the same types of elements such as gold, silver, obsidian, etc... What you are seeing is an excavation site from explorers of Earth, where they have uncovered and discovered life from this distant, yet similar, planet.

The concept of my projects was to create organic shapes out of geometric materials, which in this case are nuts and bolts. Nuts and bolts have been around before the documentation of history. They have been used as a means to build massive architectural structures ranging from skyscrapers to houses. In contrast to that I have decided to build my own structures that have no use to them. I have always been interested in mechanical organisms and I believe that including other types of mechanical parts in my work I hope to expand on this subject matter.
